

AMAN NIKUMB

SOFTWARE ENGINEER | WEB SCRAPING & DATA EXTRACTION

Gurugram, India | +91 85140 87234 | amannikumbh73@gmail.com | linkedin.com/in/aman-nikumb | github.com/aman0981

SUMMARY

Software Engineer with 2 years building production web-scraping and backend systems in Python and Golang. Builds extraction services for sites fronted by enterprise bot-management platforms, collecting public data within terms of service and polite rate limits, and upgraded an in-house extraction framework to multi-browser-engine support. Works across the stack a crawler touches: HTTP and TLS behaviour, network analysis, reverse-engineered endpoints and AWS deployment.

TECHNICAL SKILLS

Web Scraping & Browser Automation: Python, Playwright, SeleniumBase, Requests, BeautifulSoup, multi-browser-engine automation, HTML/CSS selectors, DOM parsing, pagination, crawl scheduling

Anti-Bot Mitigation & Scraper Reliability: reverse engineering, TLS fingerprinting, proxy rotation, CAPTCHA solvers, header and session rotation, retries with exponential backoff, rate-limit and HTTP 403/429 handling, enterprise bot-management platforms (Kasada, Akamai), responsible terms-of-service-aware scraping

Network Analysis & Protocols: Wireshark, browser DevTools (DOM, Network), traffic and request/response analysis, HTTP/HTTPS, TLS/SSL, headers, cookies, sessions, REST

Backend & Distributed Systems: FastAPI, Django, DRF, Celery, RabbitMQ, Golang services, asyncio, Pydantic, SQLAlchemy, Pytest, API-key/JWT security

Data, Cloud & Tooling: Pandas, SQL, PostgreSQL, MongoDB, Redis, Elasticsearch/OpenSearch, AWS (ECR, EKS, CloudWatch, S3), Docker, Git, Postman, JMeter

EXPERIENCE

Software Engineer – Data | ENGINEO SOLUTIONS PVT LTD, Gurugram

Apr 2026 – Present

Promoted from Associate Software Engineer in April 2026

- Developed the end-to-end backend system for a client travel-aggregator web portal and deployed it on AWS, working across ECR, EKS, CloudWatch and S3.
- Built data-extraction services for two hotel websites fronted by enterprise bot-management platforms (Kasada, Akamai), collecting publicly available data within each site's terms of service and polite rate limits through browser automation, session and fingerprint handling, and adaptive request pacing.
- Upgraded the in-house data-extraction framework with multi-browser-engine support, so collectors switch rendering engines per target instead of being locked to one driver.
- Wrote backend services in Golang alongside the Python stack, and built the ETL path that curates extracted data into Elasticsearch for client-facing search.

Associate Software Engineer – Data | ENGINEO SOLUTIONS PVT LTD, Gurugram

Nov 2024 – Mar 2026

- Developed the in-house data-extraction framework and a distributed extraction platform for a US travel-domain client: Playwright for JavaScript-rendered pages, Requests with BeautifulSoup for HTTP extraction, Celery/RabbitMQ pipelines, Redis, MongoDB and PostgreSQL.
- Participated in building an airline crawling bot service and developed an ETL pipeline for travel airline data.
- Built a database automation pipeline for a schema-less platform at a Big-4 consulting firm: Excel to JSON to PostgreSQL through APIs, with dynamic parent-child relational mapping and foreign-key resolution across tables, cutting manual effort by about 70%.
- Implemented Redis caching and rate limiting (40%+ fewer redundant API calls) and a layered API security stack (API keys, IP allow-listing, JWT, CORS, bad-user-agent flagging); integrated AWS S3 and OpenSearch.

PROJECTS

HireBeacon | live job-intelligence platform (solo)

hirebeacon.in

Python | Playwright | PostgreSQL (Supabase, pgvector) | GitHub Actions | Next.js | TypeScript

- Crawls 4,959 company career pages across applicant-tracking systems plus central and state government recruiting bodies, keeping 69,318 live private-sector listings continuously refreshed from official sources.
- Reverse-engineered keyless, undocumented ATS endpoints through DevTools network inspection with anti-bot handling, normalizing every vendor's payload behind one extraction contract.
- Ingestion is idempotent and self-healing: a close-out gate blocks deletions when a crawl returns under 50% of baseline, so a partial failure never wipes live listings; daily scheduled crawls; 336 automated tests.

XBRL Intelligence Engine | multi-source financial-data extraction (solo)

github.com/aman0981/XBRL_Engine

- Async Python pipeline pulling XBRL/iXBRL filings from SEC EDGAR and EU ESEF into one canonical model (24,852 facts, 71 filings), with cross-source reconciliation and restatement detection; 135 tests.

EDUCATION

B.Tech, Computer Science | GITA Autonomous College | GPA 8.54

2020 – 2024

CERTIFICATIONS & ACHIEVEMENTS

Certifications: Django Developer (LinkedIn Learning); 100 Days of Code: Python Pro Bootcamp (Udemy). **Problem solving:** 200+ problems on LeetCode and HackerRank; LeetCode 50-Days and Top SQL 50 badges.
