

AMAN NIKUMB

BACKEND ENGINEER | DATA EXTRACTION & AUTOMATION

Gurugram, India | +91 85140 87234 | amannikumbh73@gmail.com | linkedin.com/in/aman-nikumb | github.com/aman0981

SUMMARY

Two years building production backend services and data-extraction systems in Python and Golang. Ships REST APIs with FastAPI and Django over PostgreSQL, MongoDB and Redis, with Celery and RabbitMQ carrying distributed work, and delivered a client travel-aggregator portal end to end on AWS. Builds extraction services for sites fronted by bot-management platforms such as Kasada and Akamai, collecting public data within terms of service and polite rate limits. Runs a self-built live crawler across 4,959 sources keeping 69,318 listings refreshed daily.

TECHNICAL SKILLS

Backend & APIs: Python 3, Golang, FastAPI, Django, DRF, REST API design, microservices, Celery, RabbitMQ, asyncio, Pydantic, SQLAlchemy, webhooks, JWT/API-key authentication, CORS, rate limiting, Pytest

Web Scraping & Browser Automation: Playwright, SeleniumBase, Requests, BeautifulSoup, headless browsers, multi-browser-engine automation, HTML/CSS selectors, DOM parsing, pagination, crawl scheduling

Anti-Bot Mitigation & Network Analysis: reverse engineering, TLS fingerprinting, proxy rotation, CAPTCHA solvers, header and session rotation, retries with exponential backoff, rate-limit and 403/429 handling, bot-management platforms (Kasada, Akamai), Wireshark, browser DevTools, HTTP/HTTPS, TLS/SSL, cookies, sessions, responsible terms-of-service-aware scraping

Databases, Cloud & Tooling: PostgreSQL, MongoDB, Redis, Elasticsearch/OpenSearch, pgvector, SQL, Pandas, AWS (ECR, EKS, CloudWatch, S3), Docker, Git, GitHub Actions CI, Postman, JMeter

EXPERIENCE

Software Engineer – Data | ENGINEO SOLUTIONS PVT LTD, Gurugram

Apr 2026 - Present

Promoted from Associate Software Engineer in April 2026

- Developed the end-to-end backend system for a client travel-aggregator web portal and deployed it on AWS, working across ECR, EKS, CloudWatch and S3. Writes backend services in Golang alongside the Python stack.
- Built data-extraction services for two hotel websites fronted by enterprise bot-management platforms (Kasada, Akamai), collecting public data within terms of service and polite rate limits through browser automation, session and fingerprint handling, and adaptive request pacing.
- Upgraded the in-house data-extraction framework with multi-browser-engine support, so collectors switch rendering engines per target instead of one driver, and built the ETL path curating extracted data into Elasticsearch for client-facing search.

Associate Software Engineer – Data | ENGINEO SOLUTIONS PVT LTD, Gurugram

Nov 2024 - Mar 2026

- Built a database automation pipeline for a schema-less platform at a Big-4 consulting firm: Excel to JSON to PostgreSQL through APIs, with dynamic parent-child relational mapping and foreign-key resolution across tables, cutting manual effort by about 70%.
- Developed a microservice backend with Django and FastAPI supporting automated web crawlers, with Celery, RabbitMQ and Redis carrying distributed task pipelines and an event-driven webhook system for real-time alerts; Redis caching and rate limiting cut redundant API calls by 40%+, behind a layered API security stack (API keys, IP allow-listing, JWT, CORS); integrated AWS S3 and OpenSearch.
- Developed the in-house data-extraction framework and a distributed extraction platform for a US travel-domain client: Playwright for JS-rendered pages, Requests with BeautifulSoup for HTTP extraction, retries with backoff and header/session rotation; co-developed an airline crawling bot and a travel-airline ETL pipeline.

PROJECTS

HireBeacon | live job-intelligence platform (solo)

hirebeacon.in

Python | Playwright | PostgreSQL (Supabase, pgvector) | GitHub Actions | Next.js | TypeScript

- Crawls 4,959 company career pages across applicant-tracking systems plus central and state government recruiting bodies, keeping 69,318 live listings refreshed from official sources.
- Reverse-engineered keyless, undocumented ATS endpoints through DevTools network inspection with anti-bot handling, normalizing every vendor's payload behind one extraction contract; idempotent ingestion whose close-out gate blocks deletions when a crawl returns under 50% of baseline, so a partial failure never wipes live listings; 336 automated tests.

XBRL Intelligence Engine | async FastAPI service, multi-source ETL (solo)

github.com/aman0981/XBRL_Engine

- Async pipeline pulling XBRL/iXBRL filings from SEC EDGAR and EU ESEF into one canonical model (24,852 facts, 71 filings), with cross-source reconciliation and restatement detection; 135 unit and integration tests.

EDUCATION

B.Tech, Computer Science | GITA Autonomous College | GPA 8.54

2020 - 2024

CERTIFICATIONS & ACHIEVEMENTS

Certifications: Django Developer (LinkedIn Learning); Build REST APIs with FastAPI; 100 Days of Code (Udemy).

Problem solving: 200+ LeetCode/HackerRank problems; LeetCode 50-Days and Top SQL 50 badges.
